## Ultimate Flexibility For Vent Configuration

Figuring out where to safely and efficiently route the exhaust system is one of the biggest hurdles for any HVAC system designer. Noritz Common Venting offers designers the most flexibility to decide how to safely and efficiently route the vent. For room air installations, the combustion air can be drawn from the room environment, further reducing the installation complexity, by requiring only a single penetration for the exhaust.

Table 1: Vent Diameter and Maximum Equivalent Vent Length

Model	Configuration	Number Of Units	Vent Diameter (in.) and Maximum Equivalent Vent Length (feet)							
			PVC or CPVC Schedule 40 Pipe				PP Vent			
			3"	4"	6"	8"	3"	4"	6"	8"
NCC199CDV (GQ-C3260WZ-FF US)	Both Direct Vent (DV) and Non-Direct Vent (SV)	2	18'	95'	200		18'	110'	200	
		3	N/A	39'	155'	200	N/A		155'	200

		6	N/A	N/A	35'	130'	N/A	N/A	35'	130'

The BTU/h input of the unit will be reduced by up to 9%

**Note:** The sizing method shown in Table 1 is provided for the convenience of the installer. Maximum acceptable vent system static pressure drop is 0.6" W.C.

# Multi-Unit System Controller

- Each CR60 includes a pre-installed system controller (SC-401-6M).
- Each CR60 includes a pre-wired remote controller (RC-9018). Remote can be extended up to 300’
- User selectable temperature from 100-185°F

## Basic Operation

The SC-401-6M system controller is used to combine 1-6 Noritz commercial heaters into a single “multi-unit system”. The system controller stages units on and off based on hot water demand and rotates their operation to ensure even usage. It also has two additional modes which optimize the system for operation with a recirculation line or storage tank.

## Unit Staging

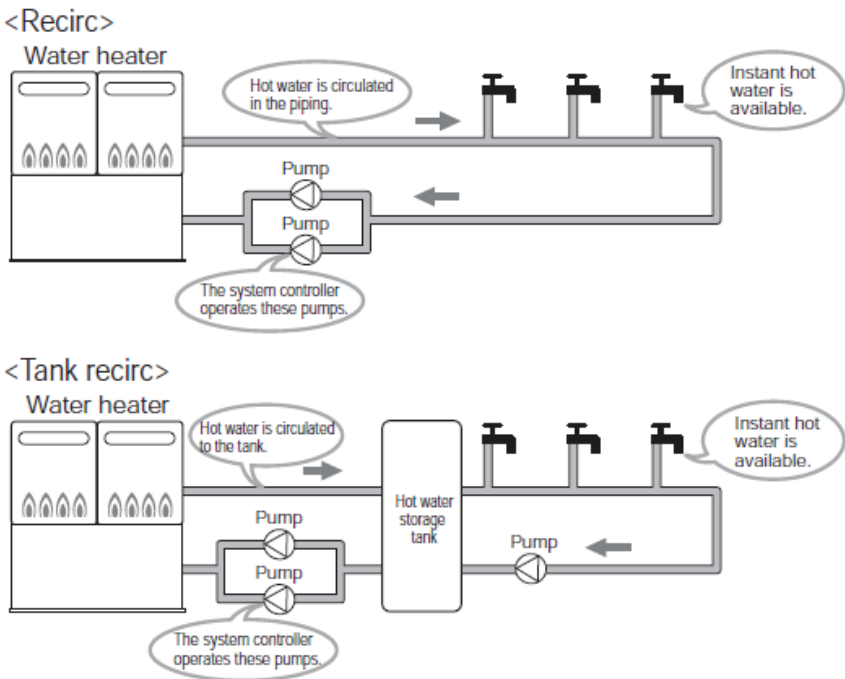

Staging allows the multi-unit system to track hot water demand from the minimum flow rate of a single unit up to the maximum output of several units. When the primary firing heater reaches approximately 50% of its maximum output, the system controller activates the next unit in the system. When both these units reach approximately 50% of their maximum output, a third unit is activated and so on. The SC-401-6M may also be configured to activate two heaters during primary firing to allow for rapid initial hot water demand.

## Unit Rotation

The SC-401-6M system controller rotates operation of the primary firing heater every 8 hours of combustion time or up to 24 hours of plug-in time. This helps to ensure even usage of all units.

Unit 1	Unit 2	Unit 3	Unit 4	Unit 5	Unit 6
1st	2nd	3rd	4th	5th	6th
• Rotation					
6th	1st	2nd	3rd	4th	5th
• Rotation					
5th	6th	1st	2nd	3rd	4th
• Rotation					
4th	5th	6th	1st	2nd	3rd

The SC-401-6M allows the user to select two additional system types: “Recirc” and “Tank Recirc”. These settings optimize performance with recirculation and storage tank systems, and allow the system controller to operate one or two pumps.
